CSE 167 [Win 19], Lecture 10: Curves 2

Ravi Ramamoorthi

<http://viscomp.ucsd.edu/classes/cse167/wi19>

Outline of Unit

- Bezier curves (last time)
- deCasteljau algorithm, explicit, matrix (last time)
- *Polar form labeling (blossoms)*
- B-spline curves
- Not well covered in textbooks (especially as taught here). Main reference will be lecture notes. If you do want a printed ref, handouts from CAGD, Seidel

Idea of Blossoms/Polar Forms

- (Optional) Labeling trick for control points and intermediate deCasteljau points that makes thing intuitive
- E.g. quadratic Bezier curve $F(u)$
 - Define auxiliary function $f(u_1, u_2)$ [number of args = degree]
 - Points on curve simply have $u_1 = u_2$ so that $F(u) = f(u, u)$
 - And we can label control points and deCasteljau points not on curve with appropriate values of (u_1, u_2)

The diagram illustrates the blossom function $f(u_1, u_2)$ for a quadratic Bezier curve. It shows a triangle with vertices labeled $f(0,0) = F(0)$ at the bottom left, $f(1,1) = F(1)$ at the bottom right, and an unlabeled top vertex. A point on the left edge is labeled $f(u,u) = F(u)$. A smooth curve starts at $f(0,0)$, passes through the point on the left edge, and ends at $f(1,1)$. The text $f(0,1) = f(1,0)$ is positioned above the triangle, indicating the value at the top vertex.

- (Optional) Labeling trick for control points and intermediate deCasteljau points that makes thing intuitive
- E.g. quadratic Bezier curve $F(u)$
 - Define auxiliary function $f(u_1, u_2)$ [number of args = degree]
 - Points on curve simply have $u_1 = u_2$ so that $F(u) = f(u, u)$
 - And we can label control points and deCasteljau points not on curve with appropriate values of (u_1, u_2)

Idea of Blossoms/Polar Forms

- Points on curve simply have $u_i = u_2$ so that $F(u) = f(u, u)$
- f is symmetric $f(0, 1) = f(1, 0)$
- Only interpolate linearly between points with one arg different
 - $f(0, u) = (1-u) f(0, 0) + u f(0, 1)$ Here, interpolate $f(0, 0)$ and $f(0, 1) = f(1, 0)$

Diagram illustrating the idea of blossoms/polar forms:

The diagram shows a triangular arrangement of points representing blossoms. The vertices are labeled $f(0,0)$, $f(0,1)=f(1,0)$, and $f(1,1)=F(1)$. The edges are labeled with u and $1-u$ to show the linear interpolation between blossoms. The curve $F(u) = f(u, u)$ is shown as a blossom with both arguments equal to u .

Below the diagram, the formula for the blossom value is given:

$$F(u) = f(uu) = (1-u)^2 P_0 + 2u(1-u) P_1 + u^2 P_2$$

- Points on curve simply have $u_1=u_2$ so that $F(u) = f(u,u)$
- f is symmetric $f(0,1) = f(1,0)$
- Only interpolate linearly between points with one arg different
 - $f(0,u) = (1-u) f(0,0) + u f(0,1)$ Here, interpolate $f(0,0)$ and $f(0,1)=f(1,0)$

A diagram illustrating the geometric interpretation of a quadratic function on a triangle. The triangle has vertices labeled 00 , $01=10$, and 11 . A point on the edge $00-01$ is labeled u and $1-u$. A point on the edge $01-11$ is labeled u and $1-u$. A point on the edge $00-11$ is labeled u and $1-u$. A curve is drawn through these points, representing the quadratic function $f(u) = 6u^2 - 6u + 1$.

Polar Forms: Cubic Bezier Curve

Geometric Interpretation: Cubic

Why Polar Forms?

- Simple mnemonic: which points to interpolate and how in deCasteljau algorithm
- Easy to see how to subdivide Bezier curve (next) which is useful for drawing recursively
- Generalizes to arbitrary spline curves (just label control points correctly instead of 00 01 11 for Bezier)
- Easy for many analyses (beyond scope of course)

Subdividing Bezier Curves

- Drawing: Subdivide into halves ($u = \frac{1}{2}$) Demo: hw3
- Recursively draw each piece
 - At some tolerance, draw control polygon
 - Trivial for Bezier curves (from deCasteljau algorithm); hence widely used for drawing

- Why specific labels/ control points on left/right?
- How do they follow from deCasteljau?

Geometrically

Geometrically

Subdivision in deCasteljau diagram

Summary for HW 3 (with demo)

- Bezier2 (Bezier discussed last time)
- Given arbitrary degree Bezier curve, recursively subdivide for some levels, then draw control polygon
- Generate deCasteljau diagram; recursively call a routine with left edge and right edge of this diagram
- You are given some code structure; you essentially just need to compute appropriate control points for left, right

DeCasteljau: Recursive Subdivision

Input: Control points C_i with $0 \leq i \leq n$ where n is the degree.
Output: L_i, R_i for left and right control points in recursion.

```

1 for (level = n ; level >= 0 ; level --) {
2   if (level == n) { // Initial control points
3     for (i = 0 ; i <= n ; i++) p_i^level = C_i ; continue ; }
4   for (i = 0 ; i <= level ; i++)
5     p_i^level = 1/2 * (p_i^{level+1} + p_{i+1}^{level+1}) ;
6 }
7 for (i = 0 ; i <= n ; i++) L_i = p_0^i ; R_i = p_i^i ;

```

- DeCasteljau (from last lecture) for midpoint
- Followed by recursive calls using left, right parts

Outline of Unit

- Bezier curves (last time)
- deCasteljau algorithm, explicit, matrix (last time)
- Polar form labeling (blossoms)
- B-spline curves
- Not well covered in textbooks (especially as taught here). Main reference will be lecture notes. If you do want a printed ref, handouts from CAGD, Seidel

Bezier: Disadvantages

- Single piece, no local control (move a control point, whole curve changes) [Demo of HW 3]
- Complex shapes: can be very high degree, difficult
- In practice, combine many Bezier curve segments
 - But only position continuous at join since Bezier curves interpolate end-points (which match at segment boundaries)
 - Unpleasant derivative (slope) discontinuities at end-points
 - Can you see why this is an issue?

B-Splines

- Cubic B-splines have C^2 continuity, local control
- 4 segments / control point, 4 control points / segment
- Knots where two segments join: Knotvector
- Knotvector uniform/non-uniform (we only consider uniform cubic B-splines, not general NURBS)

Demo of HW 3

Polar Forms: Cubic Bspline Curve

- Labeling little different from in Bezier curve
- No interpolation of end-points like in Bezier
- Advantage of polar forms: easy to generalize

deCasteljau: Cubic B-Splines

- Easy to generalize using polar-form labels
- Impossible remember without

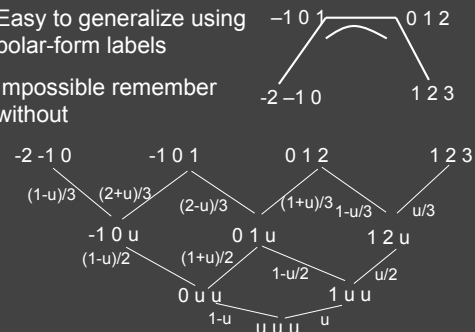

deCasteljau: Cubic B-Splines

- Easy to generalize using polar-form labels
- Impossible remember without

deCasteljau: Cubic B-Splines

- Easy to generalize using polar-form labels
- Impossible remember without

Explicit Formula (derive as exercise)

$$F(u) = [u^3 \ u^2 \ u \ 1] M \begin{bmatrix} P0 \\ P1 \\ P2 \\ P3 \end{bmatrix} \quad M = \frac{1}{6} \begin{bmatrix} -1 & 3 & -3 & 1 \\ 3 & -6 & 3 & 0 \\ -3 & 0 & 3 & 0 \\ 1 & 4 & 1 & 0 \end{bmatrix}$$

Summary of HW 3

- BSpline Demo hw3
- Arbitrary number of control points / segments
 - Do nothing till 4 control points (see demo)
 - Number of segments = # cpts - 3
- Segment A will have control pts A,A+1,A+2,A+3
- Evaluate Bspline for each segment using 4 control points (at some number of locations, connect lines)
- Use either deCasteljau algorithm (like Bezier) or explicit form [matrix formula on previous slide]
- Questions?
